

— A MYTH WORTH BUSTING

“Control-M? Isn’t that just a monitoring tool?”

I’ve heard this from senior leaders at multiple organizations. And every time, it has cost the business more than they realize.

Let’s set the record straight.

SWIPE ➡ 10 SLIDES, 2 MINUTES

— THE MISCONCEPTION

Most leadership teams see ~~40%~~ of what Control-M actually **does**.

THE MYTH

“It’s the ~~monitoring tool~~ that pings us when a job fails.”

- ✗ Treated as a passive dashboard
- ✗ Owned by “the batch team”
- ✗ Seen as legacy infrastructure
- ✗ Renewed reluctantly, never invested in

THE REALITY

It’s the **orchestration backbone** of the business.

- ◆ Schedules, executes & coordinates workflows
- ◆ Manages dependencies across SAP, cloud, data, MFT
- ◆ Predicts SLA breaches *before* they happen
- ◆ Provides audit, governance & self-service for devs

“

FROM THE FIELD

*Across **multiple organizations**, I’ve seen senior leaders label Control-M as “just monitoring” — and then wonder why month-end close keeps slipping. The tool isn’t the problem. The understanding of it is.*

— SO, PROPERLY DEFINED —

Control-M is an orchestration platform.

From BMC. Enterprise-grade. It coordinates **application and data workflows** across your entire stack — making thousands of jobs run on time, in the right order, with full visibility. Monitoring is one feature. Not the product.

35+

Years powering enterprise batch
& workflows

150+

Out-of-the-box integrations
across the stack

1B+

Jobs orchestrated daily by global
enterprises

In one line:

Control-M turns a chaotic mix of scripts, schedulers, file transfers, and APIs into one observable, reliable, and auditable workflow fabric.

THE PROBLEM

Modern stacks are noisy & fragmented.

A typical enterprise runs hundreds of cron jobs, custom schedulers, ETL pipelines, cloud functions, and SAP batch jobs — all loosely connected. When one breaks, everyone finds out from the business.

Silos everywhere. Cron on Linux, Task Scheduler on Windows, Airflow for data, native SAP jobs — nothing talks to each other.

Zero end-to-end visibility. When a downstream job fails, no one can quickly trace the upstream cause.

Missed SLAs hurt the business. Late month-end close, delayed invoicing, broken reports — real revenue impact.

Audit & compliance gaps. Manual interventions and shell scripts leave little trace for auditors.

CORE CAPABILITIES — PART 1

What Control-M actually **does.**

Workflow Orchestration

Define complex dependencies across thousands of jobs with calendars, conditions, and event triggers — no fragile scripts.

Managed File Transfer

Built-in MFT for B2B and internal flows — tracked, encrypted, and orchestrated alongside the jobs that depend on them.

SLA & Service Management

Tag critical workflows with SLAs. Control-M predicts breaches early and escalates before the business even notices.

Hybrid & Multi-Cloud

One control plane across mainframe, on-prem, AWS, Azure, GCP, Kubernetes, Snowflake, Databricks, and more.

CORE CAPABILITIES — PART 2

Built for **DevOps** & the modern stack.

Jobs-as-Code

Define workflows in JSON / YAML, version them in Git, and deploy through CI/CD — just like application code.

Predictive Analytics

ML-based forecasting on job duration and SLA risk. Spot tomorrow's incident today.

Self-Service for Devs

Application teams build, test and submit their own workflows — with guardrails Ops actually trust.

Audit, Reporting & APIs

Full audit trail, role-based access, REST APIs, and dashboards for ops, business, and compliance.

SPOTLIGHT USE-CASE

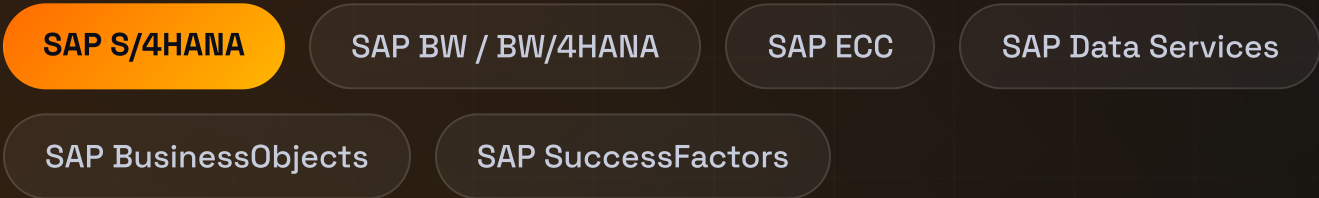

Why **SAP** needs real orchestration.

SAP is the digital backbone for finance, supply chain, HR and operations. But SAP rarely lives alone — data flows in and out of dozens of upstream and downstream systems every single hour.

A typical SAP day looks like this:

Source files land from suppliers → loaded into **SAP S/4HANA** → **BW/4HANA** process chains crunch the data → reports refresh in **SAC / BusinessObjects** → outputs sent to banks, regulators & partners.

Miss *one* step — month-end close slips.

— CONTROL-M FOR SAP

One control plane. All of SAP. Plus everything else.

Control-M	Single pane of glass · SLAs · alerting · audit · self-service · APIs
Native SAP Module	Manages SAP background jobs, criteria-based selection, intercept & child jobs, output & spool capture.
SAP Workloads	S/4HANA · BW Process Chains · ECC R/3 · Data Services · BusinessObjects · SuccessFactors
Non-SAP Stack	Cloud (AWS / Azure / GCP) · Snowflake · Informatica · Kafka · Linux/Windows · MFT · APIs
The result: a single, dependency-aware workflow that spans SAP <i>and</i> the systems around it — not two disconnected schedulers pretending to coordinate.	

BUSINESS VALUE

Why the CFO cares about this.

For the Business

- ◆ Faster, predictable **month-end close**
- ◆ On-time financial & regulatory reporting
- ◆ Fewer SLA breaches & happier customers
- ◆ Audit-ready evidence by default
- ◆ Confident SAP S/4HANA migrations

For IT & Ops

- ◆ One tool replaces 5+ schedulers
- ◆ Drastically fewer 2 AM incident calls
- ◆ Faster root-cause across SAP & non-SAP
- ◆ Dev self-service without losing control
- ◆ Cloud-ready: lift, shift & orchestrate

60%

Reduction in batch-related incidents reported by enterprises*

2x

Faster month-end close cycles after consolidation

1

Single audit trail across SAP and the rest of the stack

* Indicative ranges based on publicly shared BMC customer case studies.

— WRAPPING UP

If your jobs run the business, orchestrate them like they do.

Control-M isn't just a scheduler — it's the operational fabric that keeps SAP, data pipelines, cloud workloads and file transfers running as one coordinated business service.
